ASSIGNMENT-2

CREATE VISUALISATIONS

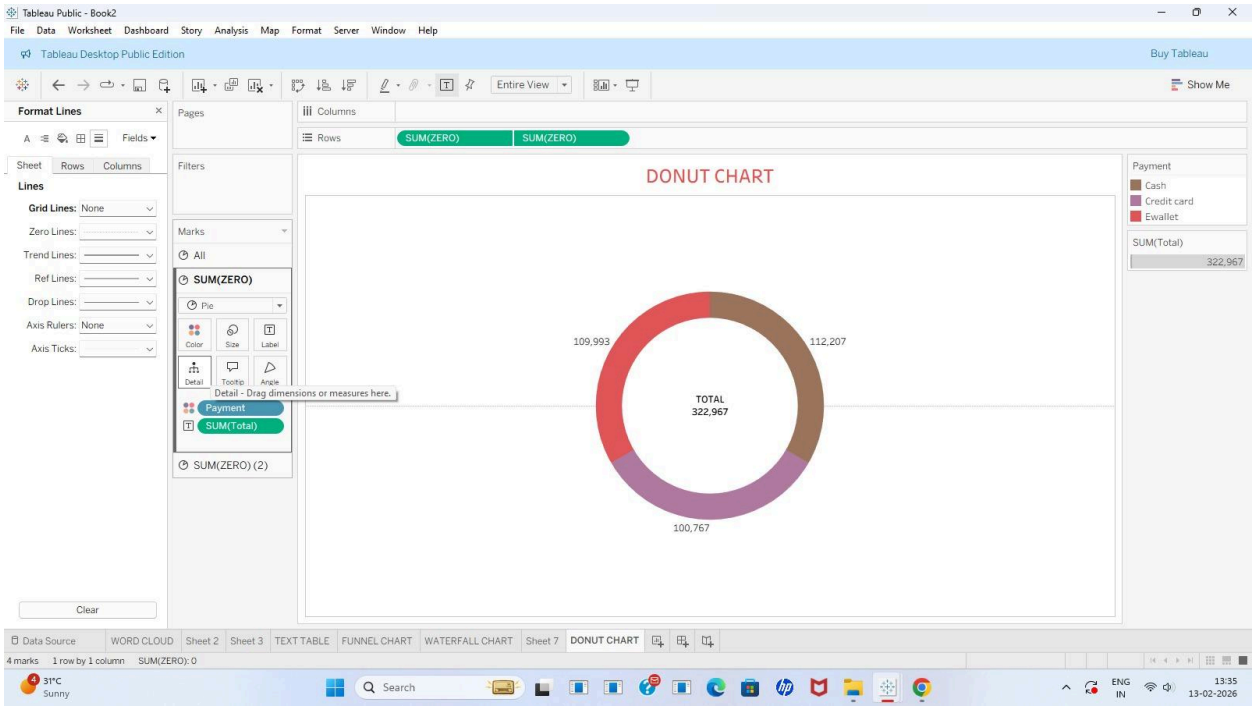
★ **Donut Chart**

❖ **Donut Chart - Purpose**

- A donut chart is used to show how different categories contribute to a total value.

➢ **HOW TO CREATE A DONUT CHART IN TABLEAU(CLEARLY EXPLAINED)**

- Start by connecting your dataset in Tableau and open a new worksheet.
- Drag the category field, such as Payment Type, to the Color option in the Marks card.
- Drag the measure, such as Sales or Total Amount, to the Angle option.
- Change the Marks type to Pie.
- Now you will see a pie chart.
- Adjust the Size slider to make the pie bigger.
- To create the donut hole, create a calculated field and name .
- Drag the Zero field to the Columns shelf two times.
-
- Right-click on the second Zero field and select Dual Axis.
-
- Right-click again and choose Synchronize Axis.
- Now two pie charts are placed on top of each other.
- Click on the second Marks card.
- Remove the category field from Color
- so it becomes a single color.
- Change the color to white (or the background color).
- Reduce the Size so it becomes smaller than the first pie chart.
- This smaller white pie creates the hole in the center, forming a donut shape.
- To display the total value in the center, drag the Sales or Total field to Label in the second Marks card.



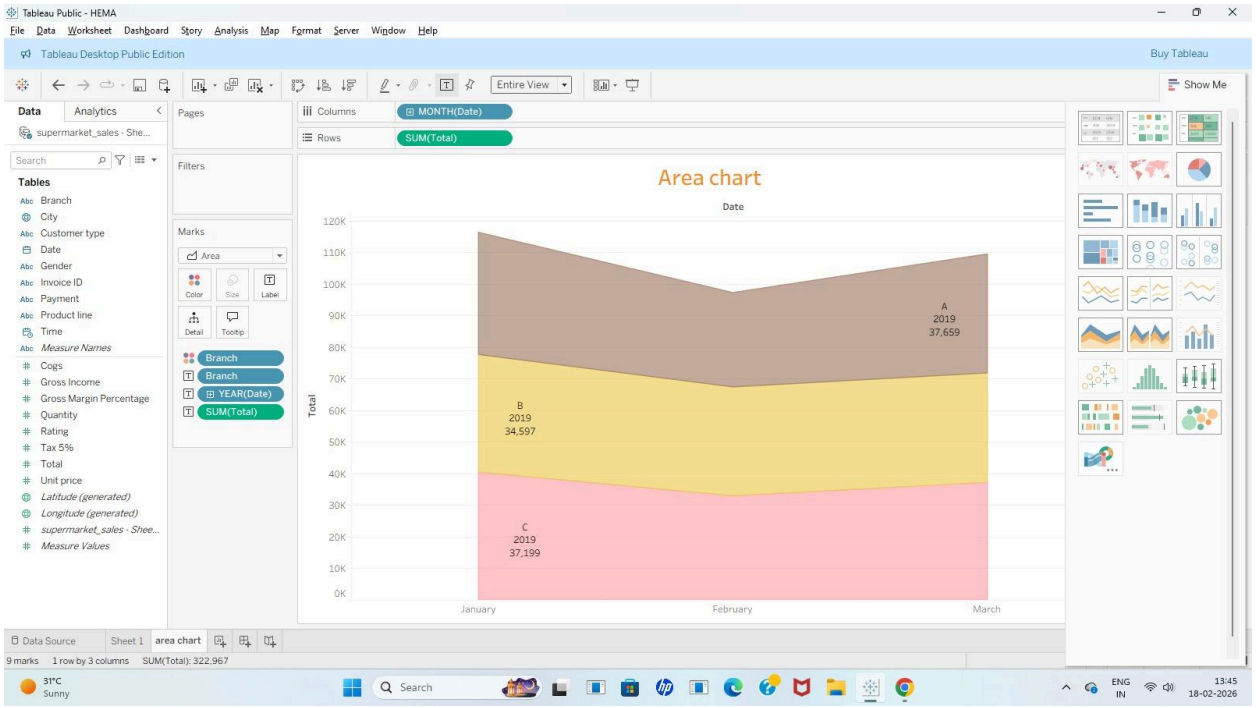
★ **Area Chart**

❖ **Area Chart - Purpose**

- An area chart is used to show how values change over time while also highlighting the magnitude of those values.

➢ **HOW TO CREATE AN AREA CHART IN TABLEAU(CLEARLY EXPLAINED)**

- Open Tableau and connect your dataset. Go to a new worksheet.
- Drag the Date field to the Columns shelf.
-
- If it shows as Year, click on it and change it to Month (or the time level you want).
- You will see a line chart by default.
- Now go to the Marks card and change the chart type from Automatic or Line to Area.
- The line will now be filled with color, forming an area chart.
- This creates a stacked area chart where each color represents a different branch.
- You can add labels by dragging the measure (Total Sales) to Label in the Marks card.
-
- Adjust formatting such as colors, title, and grid lines to make the chart cleaner.



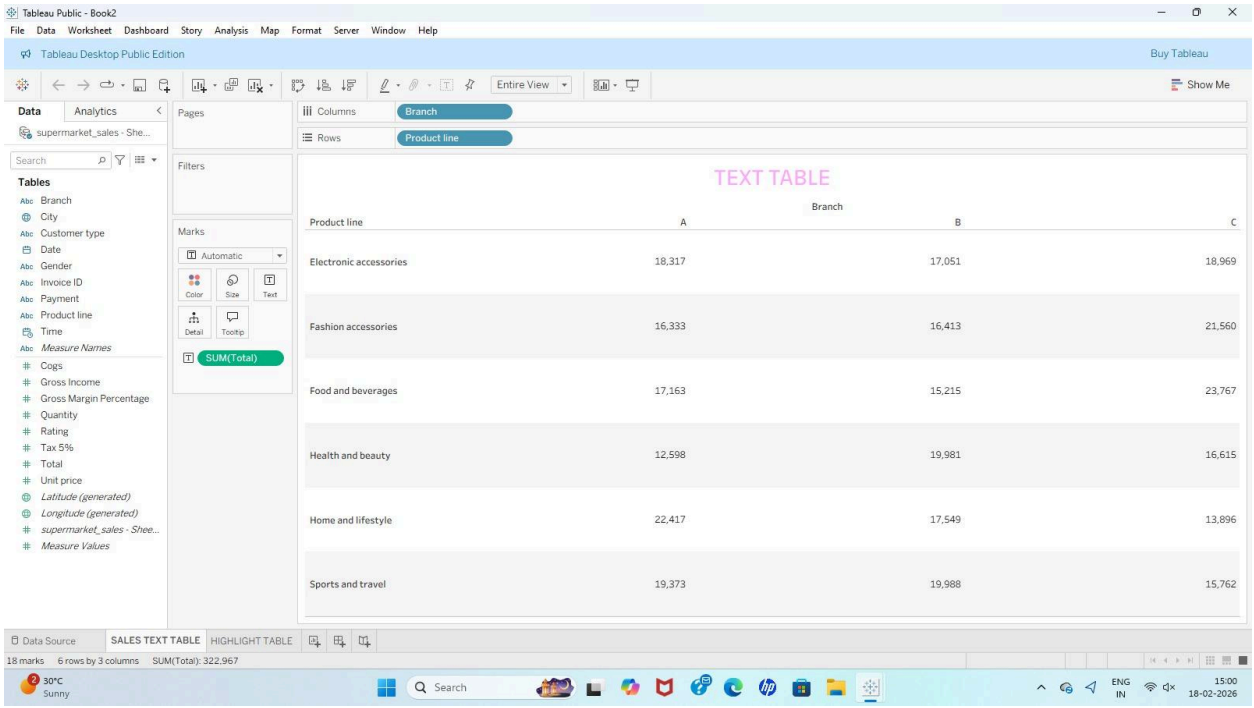
★ **Text Table**

❖ **Purpose of a Text Table**

- The purpose of a Text Table is to present summarized data in a clean and organized format so comparisons can be made easily between.

➢ **HOW TO CREATE A TEXT TABLE IN TABLEAU**

- Open Tableau and load your dataset so the fields appear in the Data pane.
- Create or open a worksheet where the table will be built.
- Next, drag another categorical field such as Branch into the Columns area.
- Now choose a numerical field like Total Sales and drag it onto the Text option in the Marks card.
- You can then improve readability by formatting fonts, alignment, shading, or adding totals using the Format menu.



★ **Highlight Table**

❖ **Purpose of Highlight Table**

- The purpose of a Highlight Table is to make comparison easier by visually emphasizing differences in data. It allows users to quickly identify patterns, high performance, low performance, and trends across categories.

➢ **HOW TO CREATE A HIGHLIGHT TABLE IN TABLEAU**

- Open Tableau and load your dataset so all fields appear in the Data pane. Go to a worksheet where you want to build the visualization.

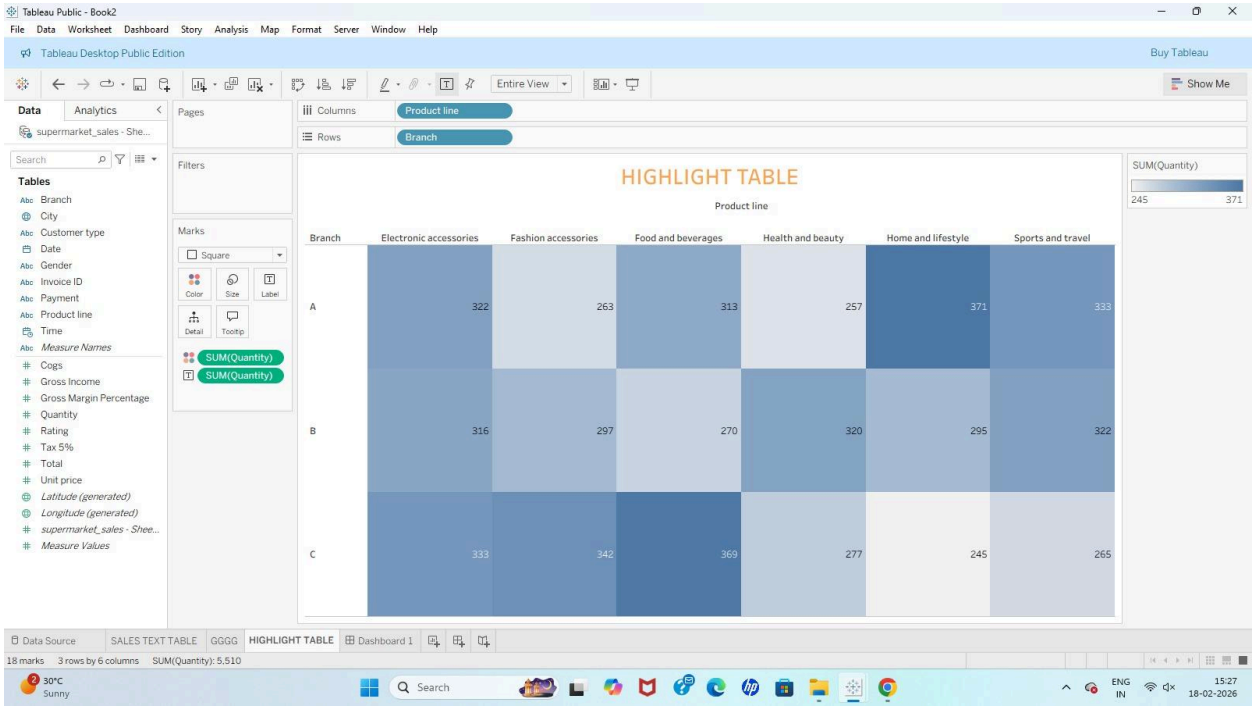
- Choose a categorical field such as Branch and place it in the Rows shelf so row labels are created. Then choose another categorical field such as Product Line and place it in the Columns shelf to form column headers.

- Select a numerical measure like Quantity and drag it to the Marks card so values appear in the view. Make sure the values are shown as labels inside the cells.

- After the numbers appear, drag the same measure again onto the Color option in the Marks card. Tableau automatically applies color shading across the table based on value intensity.

- If the table does not look highlighted, open the Show Me panel and choose Highlight Table. Tableau converts the display into colored square cells.

- Finally, adjust colors, shading, or formatting if needed using the Color settings to improve visibility.



★ Word Cloud

❖ Purpose of a Word Cloud

- The purpose of a Word Cloud is to visually highlight dominant categories or frequently occurring items in data. Instead of reading numbers in tables, users can instantly recognize which product lines, keywords, or categories contribute more based on word size.

➢ HOW TO CREATE A WORD CLOUD IN TABLEAU

- Open Tableau and connect your dataset so fields are visible in the Data pane.

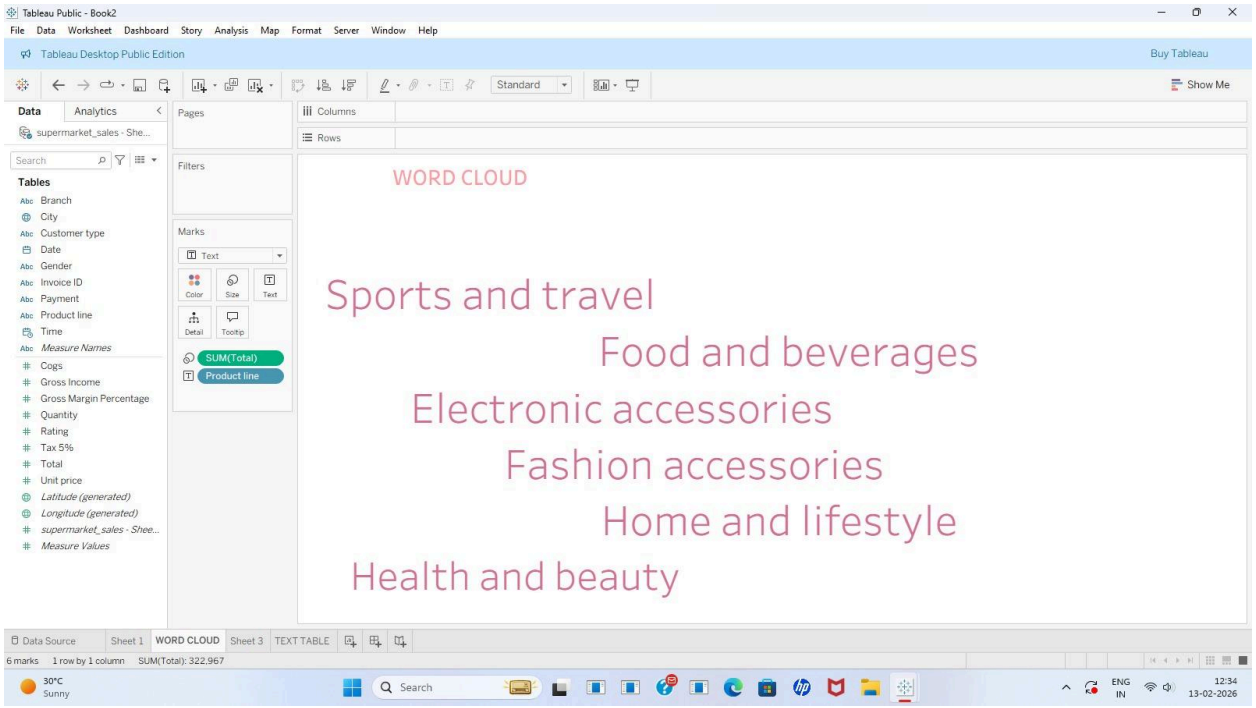
- Select a categorical field such as Product Line and drag it to the Text area in the Marks card so the words appear in the view.

- Then select a numerical measure such as Total Sales and drag it to the Size option in the Marks card.

- Change the Marks type to Text if it is not already selected.

- Optionally, drag the same measure to Color to add color variation or adjust formatting to improve readability and appearance.

- You can also open the Show Me panel and choose Word Cloud, which automatically applies the required settings.



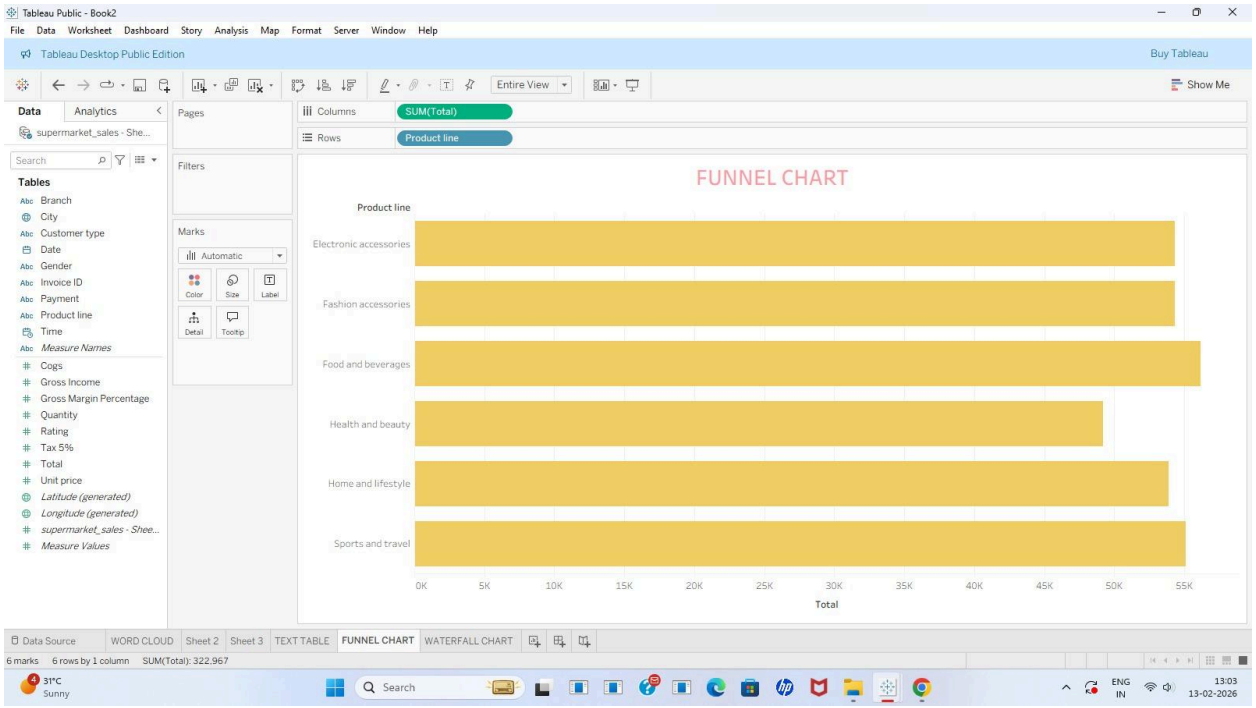
★ **Funnel Chart**

❖ **Purpose of a Funnel Chart**

- The main purpose of a Funnel Chart is to visualize how data moves through different stages or categories and to identify where values increase or decrease.

➢ **HOW TO CREATE A FUNNEL CHART IN TABLEAU**

- Open Tableau and load your dataset so all fields appear in the Data pane.
- Drag a categorical field such as Product Line into the Rows shelf so each category appears as a separate bar.
- Drag a numerical measure such as Total Sales into the Columns shelf.
- Sort the measure in descending order so the largest value appears at the top.
- Change the Marks type to Bar if needed so solid bars are displayed
- Apply formatting such as color, labels, and titles to improve readability and presentation.



★ **Waterfall Chart**

❖ **Purpose of a Waterfall Chart**

A waterfall chart is a visualization used to show how different values add up step-by-step to form a final result. Instead of displaying only totals, it explains how each category contributes to the overall change.

➢ **HOW THE WATERFALL CHART WORKS**

- Begin by opening Tableau and loading your dataset.
- First, place the category you want to analyze, such as Product Line, onto the Columns shelf.
- Next, drag the numeric measure, such as Total Sales, onto the Rows shelf.
- After that, convert the values into a cumulative calculation. Right-click the measure placed on Rows and apply a Running Total table calculation.
- Ensure the calculation direction is correct by editing the table calculation and setting it to compute across the category field.
- Finally, format the chart by adding labels, adjusting colors, and giving the visualization a clear title.
